Shift to Continuous Releases

Adoption of DevOps

DevOps (development and operations) is an enterprise software development phrase used to mean a type of agile relationship between development and IT operations. The goal of **DevOps** is to change and improve the relationship by advocating better communication and collaboration between these two business units. (webopedia.com)

Adoption of DevOps – Many different meanings

People - Culture

Value Stream Management

- A value stream is the sequence of activities an organization undertakes to deliver on a customer need
- Value stream per product, application or service
- Organizations have focused on reducing waste by optimising Agile and now DevOps Lead Times
- But still struggle with visibility & management at cross product (portfolio) level and optimizing value in approval centric IT environment (service)

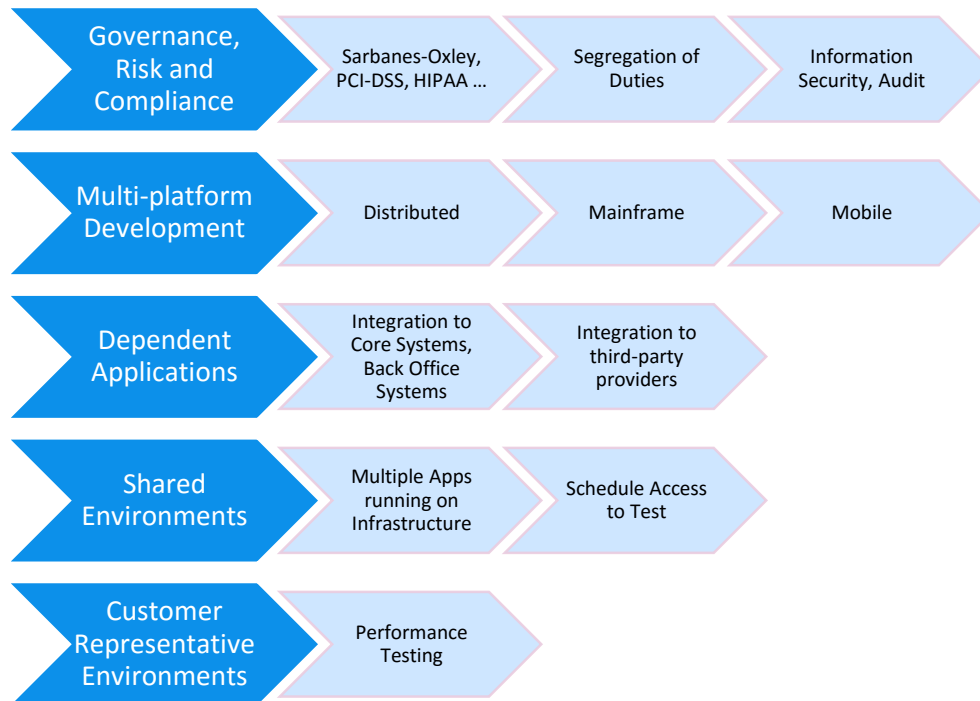

Most Organisations are “Multi-modal”

*Iterative and Incremental Development

And need to Balance Agility and Control

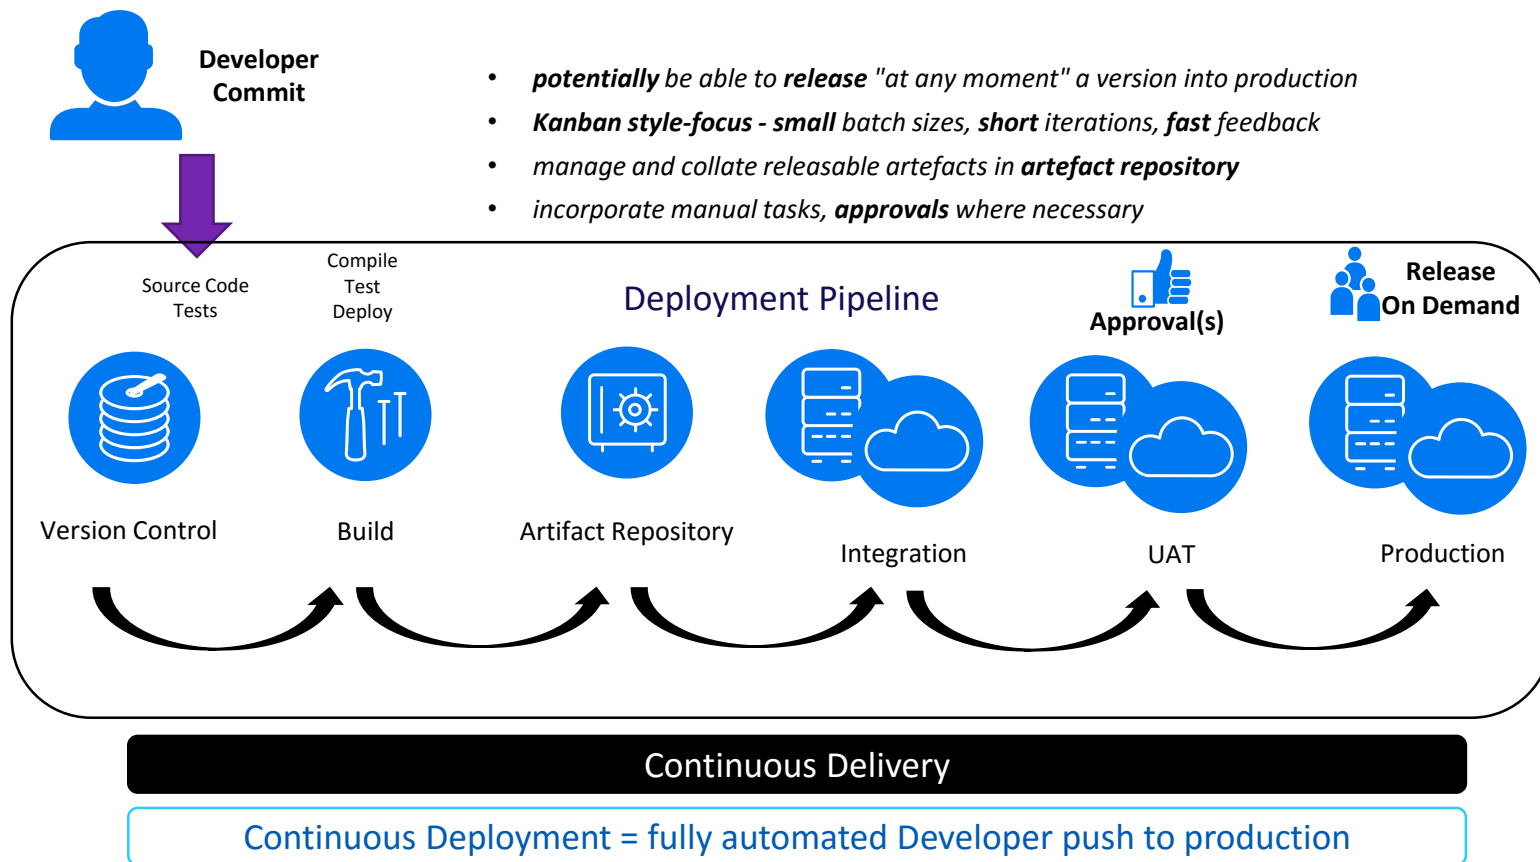

“Move fast without breaking things”

Implementing Continuous Delivery

What is Continuous Delivery?

Example Continuous Delivery Capabilities

Agile / Kanban

Continuous Integration

Automated build, artifact staging and code level testing

Integration to deployment pipeline

Configuration Automation

Convergent - self healing infrastructure

Automated infrastructure provisioning for environments

Environment inventory

Artefact repository for releasable binaries

Deployment Automation

Rollback automation

Self-service deployments into environments

Fully automated "single-click" deployments

Test Automation

Auto provisioning of "Production" like environments for testing

Automated performance testing of all devices

Automated API-level testing

Automated functional testing on all devices

Data Migration

Automated customer reference data migrations

Automated schema and instance data migrations

Release Coordination

Integration to Change Management

Environment Scheduling and Planning

Planning and Execution of multiple/dependent applications (runbook)

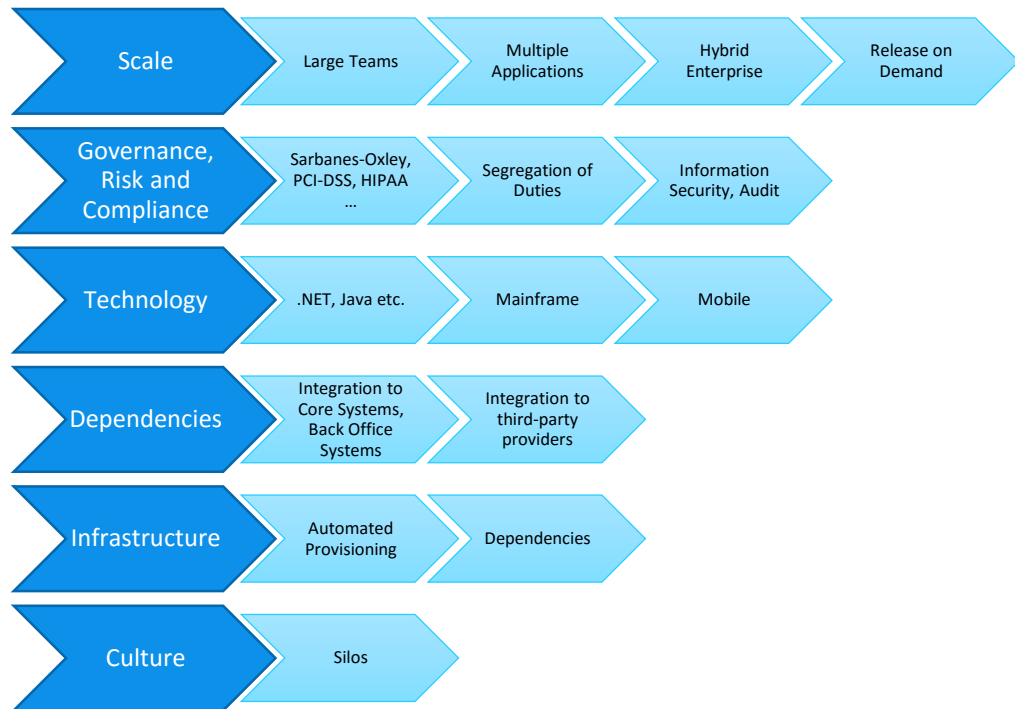

Performance Monitoring

Real User Monitoring

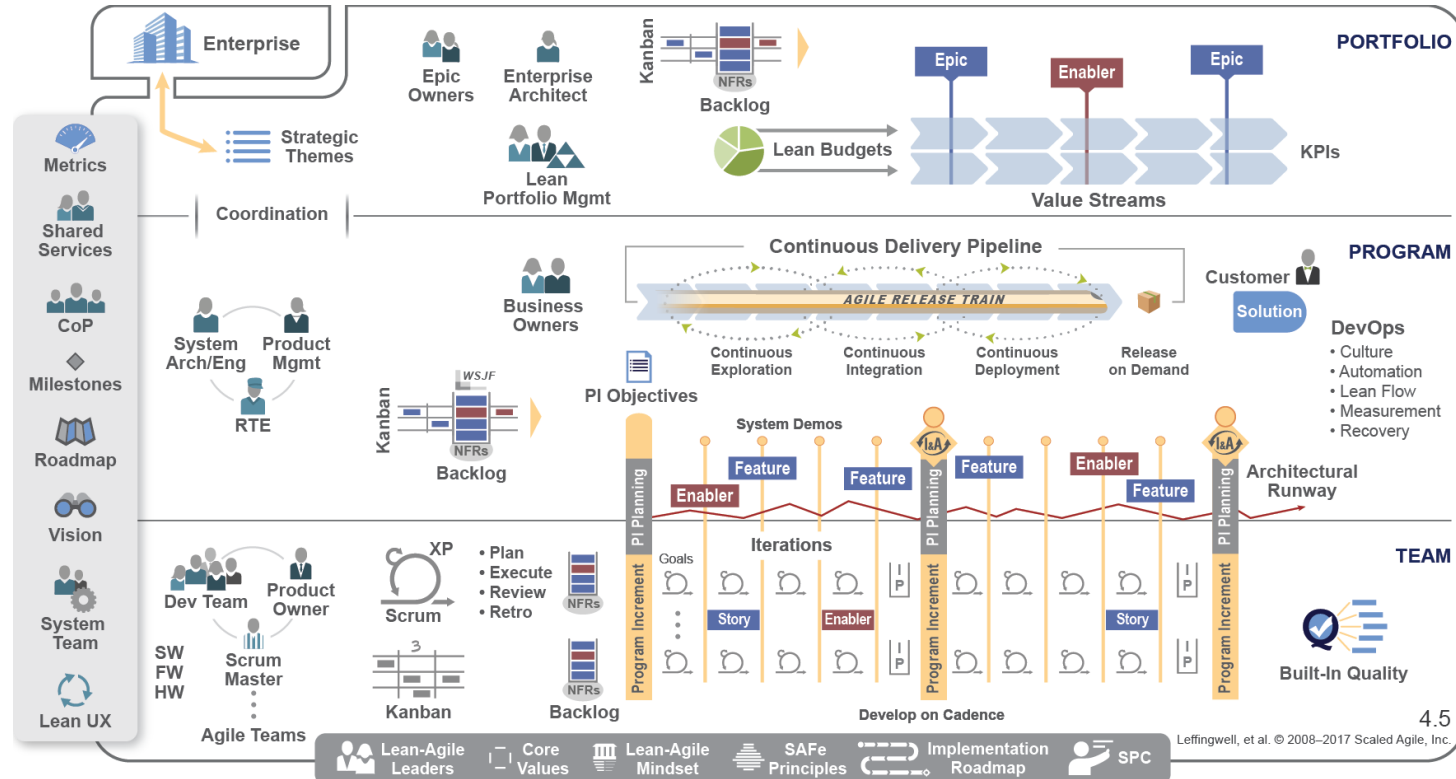

Synthetic Monitoring

Collaboration/Communication

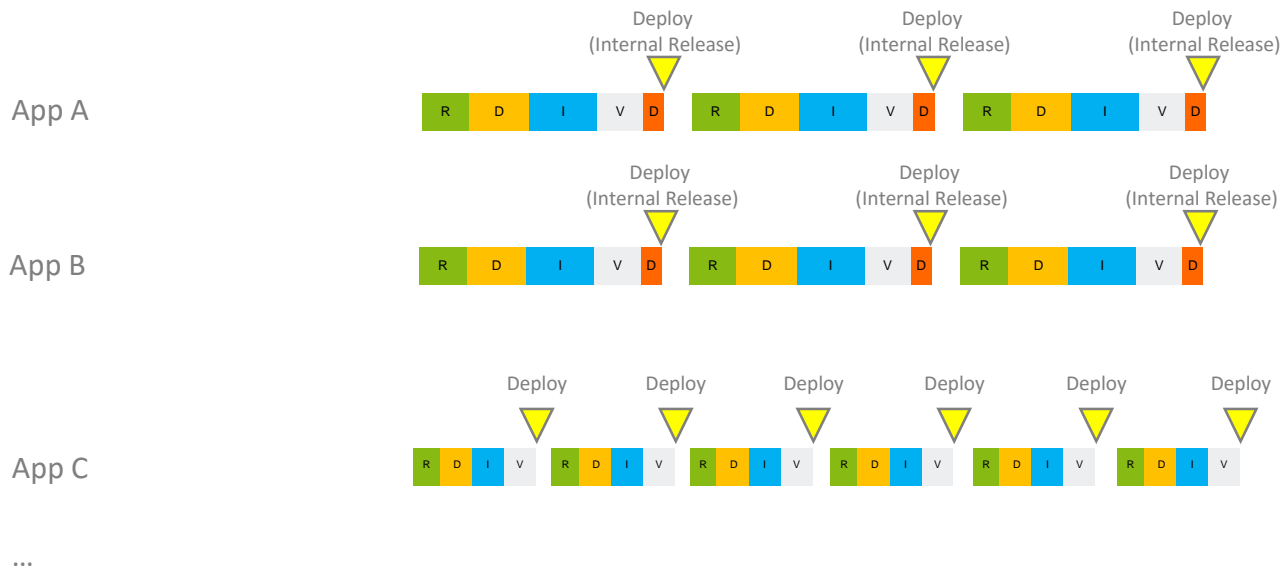

Continuous Delivery Challenges

Scaled Agile Framework (SAFe)?

Continuous Delivery & Release Management

Automate for All Technologies

Type	Examples	Automation Process
Flat File	HTML, PHP	File Transfer
Scripted (direct)	Shell, Batch	File Transfer, Execute Directly
Scripted (command)	SQL, MQ, Forms	File Transfer, Incremental, Adhoc Execution
Installer	MSI, RPM, DAC	File Transfer, Execute via Command
Extract and Load	Siebel, SAP, Informatica	Extract from Environment A, Transfer and Load into Environment A via Commands
Application Archive	WARs, EARs (WebSphere, JBoss)	File Transfer, Deploy into App Server via APIs
Container	Docker	Pull Images from Tag, Stop/Start Container via Commands
Configuration	Property Files	File Transfer, Replace Tokens
Batch Jobs	Mainframe Cobol	Promote, Schedule Execution

Adhoc Deployment Manifest Example

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<release>
  <name>Adhoc Deployment Example</name>
  <description>Release file for System A</description>
  <system>System A</system>
  <subsystem>Customer Portal</subsystem>
  <date>24/06/2017</date>
  <version>1.2</version>
  <deployment>
    <files>
      <file name="somefile.sh" type="script" version="1.6" source="somedir/bin"
        destination="$SOME_HOME/bin" copy="true" chmod="755" execute="true"/>
      ...
    </files>
  </deployment>
  <rollback>
    ...
  </rollback>
</release>
```

**Release details with
“deployment” and
“rollback” sections**

type=script|sql|file
Determines type of file and what to
automate

Version=[SCM Version]
Input manually or automatically
from SCM

copy=true|false
Copy file from source to
destination, chmod if necessary

Execute=true|false
Execute the file automatically

Decouple Release from Deployment

Rolling Deployments

- New versions deployed onto a limited set of servers to see how they perform
- Typically load balancer points at multiple current versions and one instance of new “canary” release

Blue-Green Deployment

- Running versions of your app in “blue” production environment
- New versions deployed to “green” environment, switched over (via “load balancer” on successful deployment, test

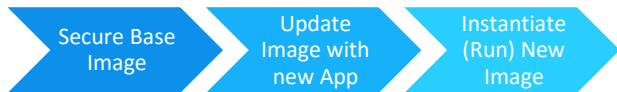

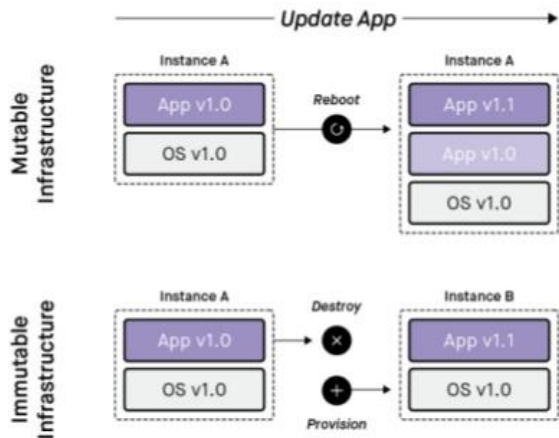

Configuration Updates

- No code deployment, only make changes to configuration files (debugging / feature flags)

Feature Flags

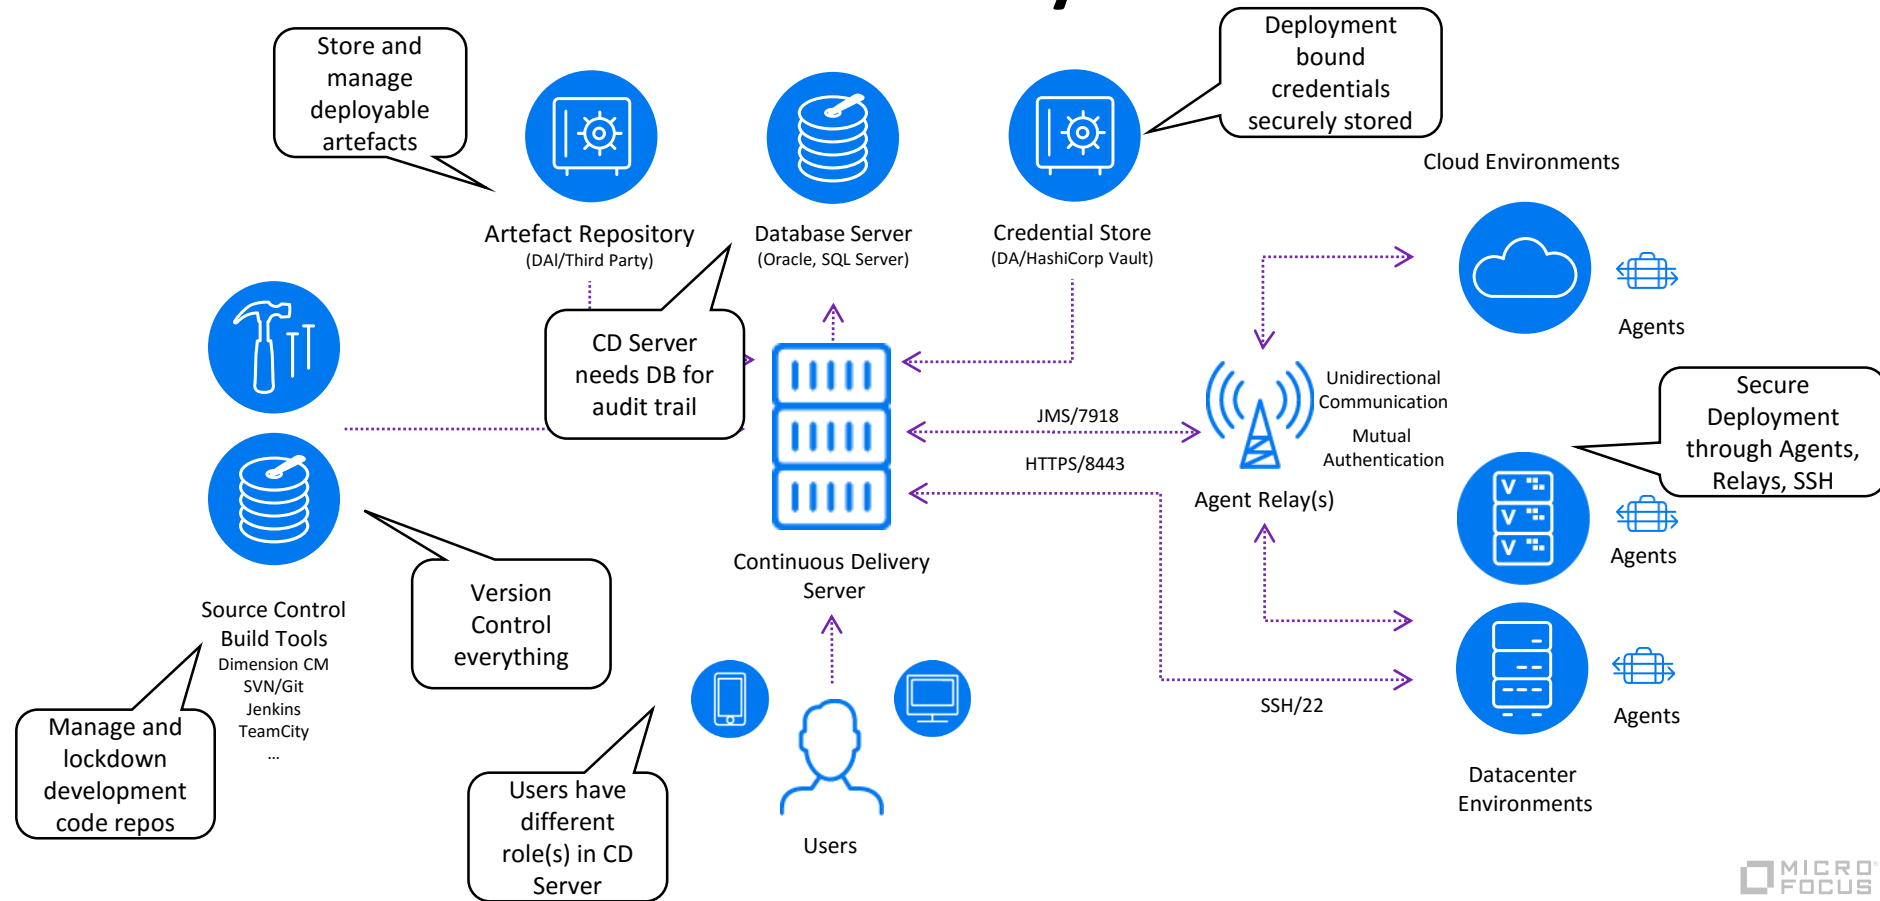

- Turn already deployed features on/off through updates in configuration

Implement immutable infrastructure

- Next level on from Blue-Green deployment
 - ~~Deploy onto existing infrastructure!~~
 - Programmatically spin up new servers for each new application deployment
- Guarantees validity / security of infrastructure and remediates configuration drift
- Really needs Infrastructure as a Service platform.
- Can similarly be implemented using containerization (Docker) – but base image needs to be secure.

Harden Continuous Delivery infrastructure

Micro Focus Solutions

Micro Focus Portfolio and Lifecycle Management

Accelerating an organization's ability to securely deliver **high-quality** applications at **enterprise scale** and manage, track, and **unlock the value** of investments you've already made.

Micro Focus Deployment Automation

Deployment Automation enables repeatable, reliable and audit-compliant processes to simplify application deployments, reduce risk and increase the velocity of delivery across all environments of your delivery pipeline.

Easy-to-use graphical editor

The screenshot shows the Deployment Automation (DA) web interface. The browser address bar indicates the URL is `localhost:8080/da/app#/management/configurations`. The interface has a blue header with the title "Deployment Automation" and a user profile "Rita Release Manager". Below the header is a "Management" section with a navigation bar containing icons for Applications, Components, Environments, Deployment Packages, Pipelines, Resources, Global Processes, and Configuration (which is highlighted). The main content area is titled "Configuration" and features a search bar, a dropdown for "Application / Component / Environment", and a "Component Properties" dropdown. A table displays the properties for the selected component, with columns for Name, Label, Required, Value, and Description. The table lists four properties: database.name, database.password, database.server, and database.username. The footer of the interface contains the copyright notice: "Copyright © 2018 Serena Software, Inc., a Micro Focus company. All Rights Reserved."

Name	Label	Required	Value	Description
database.name	Database Name	true	aos-uat	Database Name
database.password	Database Password	true	****	Database Password
database.server	Database Server	true	aos-uat001.microfocus.com:1433	The database server hostname and port for the environment, e.g. localhost:3306
database.username	Database Username	true	aos-uat	Database Username

Pipeline automation and visibility

SUPPORTS SEAMLESS, NO TOUCH DEPLOYMENTS, FROM DEVELOPMENT TO PRODUCTION

DEPLOYMENT SEQUENCE CAN BE ENFORCED VIA PIPELINES

GATE CONDITIONS AND APPROVALS CONTROL DEPLOYMENT INTO ENVIRONMENTS

ENFORCES ACCURATE ENVIRONMENT CONTENT AND COMPLIANCY

The screenshot displays the Deployment Automation (DA) web interface. The top navigation bar includes the DA logo, a search bar, and user information (Rita Release Manager). The main menu has tabs for Activity, Details, Components, Environments (selected), Processes, Tasks, Snapshots, History, and Security. The main content area shows a pipeline view with four stages: Systems Integration, Acceptance Test, Performance Test, and Production. Each stage has a 'Resources' bar and a 'Components 3' button. Below the pipeline is a table of components with their versions, snapshots, and compliance status across the stages.

Component	Systems Integration	Acceptance Test	Performance Test	Production
aos-db	Version: 1.0-2 Compliance: ✓ (1/1) Status: Active	Version: 1.0-1 Snapshot: Rel 1.0 - Sprint 001 Compliance: ✓ (1/1) Status: Active	Version: 1.0-1 Snapshot: Rel 1.0 - Sprint 001 Compliance: ✓ (1/1) Status: Active	Version: 1.0-1 Snapshot: Rel 1.0 - Sprint 001 Compliance: ✓ (1/1) Status: Active

Release Management – Example Add-on

Leverage customers existing portfolio

- Where can we add value:
 - Governance
 - Security
 - Visibility
- Integrate with Open Source
- Integrate with Micro Focus
 - ADM – Octane
 - ITOM – DA / HCM

Deployment Automation benefits:

- Simplify, standardize, and **automate** the deployment of the most complex multi-tier applications
- Seamlessly deploy and maintain applications across **heterogeneous**, distributed physical, virtual, container, and cloud servers whilst maintaining audit, compliance and reducing risk
- Ensure that components tested together are released together—use the **same deployment process** for seamless automated deployments, from development to production
- **Reduce application failures** in data center production by **up to 90%**
- Cut the time and cost of managing deployments **by up to 80%**

Deployment Automation: Customer Proof

” *“Serena (now part of Micro Focus) Deployment Automation has provided us with all the benefits that we expected it would, our original business case has been realized, and we now expect to gain further value as we roll it out to the rest of the organization”*

CHRIS RISEBROW – Allianz Project Delivery Manager, Allianz

” *“We had three goals: reduce release complexity, shorten the deployment cycle so that it could be done in just a few clicks, and comply with new regulations.”*

CYRIL THENON - Manager, Performance and Industrialization Skill Center, Generali France

” *“Serena (now part of Micro Focus) Deployment Automation provides Gordmans with enterprise-class, develop-to-deploy release management and gives us the visibility, tracking, and deployment automation capability we require.”*

CHRISTOPHER BERGQUIST & Information Security Manager, Gordmans

Release Control benefits:

- **Visibility and Tracking:** Centralized release calendar, process metrics, and dashboards
- **Compliance and Control:** Process enforcement, routing, and approvals with built-in audit trails and reports
- **Multi-Platform Support:** The only release management solution that supports both mainframe and distributed
- **Process Automation:** Automation and workflow that replace manual process steps to enforce your release policies and processes
- **Integration:** Flexible and open architecture that allows easy integration to current enterprise tools via an extensible, enterprise ready plugin architecture

Release Control: Customer Proof

” *“With Serena (now part of Micro Focus) Release Control we have a reliable and repeatable release process, greater visibility into the release activities for all of our stakeholders and significantly improved confidence in our compliance with international laws and internal audit requirements.”*

- Reduced release window; production release reduced from 3 hours to 35 minutes
- Anticipated benefits of up to \$3M annually through broad use of Release Control
- Gained an internal rate of return of 185 percent over five years

- Eliminated audit and compliance risks
- Provided stakeholders clear insight into the impact of changes to its respective applications and assets
- Automated promotion of changes into production removing major source of errors
- Delivered greater environment stability, predictability and reliability
